SUMMARY

Senior software engineer with 12 years of experience across web, mobile, AI automation, and desktop applications. Most of my recent work has focused on backend API integration, AI automation, Website development, mobile App development using React Native, Flutter. Earlier experience includes dataset metadata services, MSP event pipelines, banking dashboards, and operations-heavy backend tools built with Python, Node.js, PostgreSQL, Redis, Docker, AWS, and SQL Server.

PROFESSIONAL EXPERIENCE

New Holland (DASSA) | Gerente de Servicio

Senior Full-stack developer, AI/ML Evaluation Specialist Remote | 06/2024 – 06/2026

- Developed and maintained scalable web applications for clients across various industries, focusing on performance, user experience, and security.
- Built custom content management systems (CMS) and e-commerce solutions with Laravel, React, and Node.js. Integrated payment systems (Stripe, PayPal, etc.) for seamless transactions in web applications.
- Implemented real-time features using Web Sockets and APIs for dynamic, interactive applications.
- Worked with front-end frameworks like React.js and Next.js to build responsive, user-friendly UIs that meet client requirements.
- Deployed and maintained applications using cloud services like AWS, Digital Ocean, and Vercel.

Invisible Technologies

Senior Backend Engineer Remote | 03/2023 - 06/2024

- Review 50-80 model responses on high-volume days across **Python**, **JavaScript**, **TypeScript**, **SQL**, and backend-design prompts, checking whether answers are correct, runnable, safe, and useful to a technical user.
- Test selected coding answers in isolated **Docker** sandboxes with network access disabled, memory limits, and timeout controls to catch missing dependencies, fabricated APIs, version issues, and code that only looks correct in plain text.
- Built a **Pandas**-based review helper for a 5,000-sample fine-tuning batch that flagged missing tests, unclear package assumptions, weak reasoning, and examples that needed deeper manual review before final QA.
- Write structured **JSON** feedback with scored dimensions, evidence notes, and short reviewer comments so response comparisons can be reviewed without rereading every prompt from the beginning.
- Maintain a shared gray-area decision log for ambiguous prompts and bring those examples into weekly calibration sessions with a ten-person QA group to reduce scoring drift.
- Found a **Python 3.8** versus **3.10** mismatch in a benchmark harness, reproduced the issue, documented the affected cases, and helped the team revisit 500 evaluations before client delivery.

NVIDIA

Senior Software Engineer Remote | 04/2018 - 02/2023

- Designed a **Python** and **FastAPI** metadata service that indexed **JSON**, **CSV**, and **Parquet** evaluation outputs from **AWS S3** into **PostgreSQL JSONB**, giving researchers a faster way to compare prior runs without opening raw files manually.

EDUCATION

Bachelor degree in System Engineering

Institute of Technology of Sonra
08/2007 - 05/2011 · Sonora, Mexico

Diploma in Automotive After-Sales

Tecnológico de Monterrey
06/2023 - 03/2024 · Guasave, Mexico

Master degree in Information Technology

TripleTen
06/2025 - 03/2026 · Estado de México

TECHNOLOGY EXPERTISE

Web Development:

CMS (Wordpress, Shopify, Wix, Webflow, Framer, Drupal, Magento), Laravel / PHP, ASP.NET / C#, React / Node.js

Backend Engineering:

Python, PHP, Node.js, FastAPI, REST APIs, Celery, OAuth 2.0, webhooks, background jobs, middleware, API design, service integration.

Data Systems & Databases:

PostgreSQL, PostgreSQL JSONB, SQL Server, Redis, Firebase, Pandas, NumPy, ETL pipelines, indexed queries

Cloud, DevOps & Tooling:

AWS S3, Docker, Linux, Git, GitHub Actions, CI/CD workflows

Mobile Development:

React Native, Flutter

Programming Languages:

C, C++, PHP, C#, ASP, Java, Python, R, QT, Object C

PROJECTS

LLM Response Evaluation Toolkit

01/2025 - Present

- Built a **Python**-based toolkit to batch-review LLM outputs against custom rubrics for correctness, safety,

- Wrote **Python** and **Node.js** correlation-ID middleware adopted by 15+ service teams, making failed jobs easier to trace across APIs, workers, and pipeline logs.
- Reworked noisy monitoring rules by replacing static thresholds with three-sigma alerting and review notes from recurring incidents, cutting repeated false-positive alerts by roughly 80% during the next review cycle.
- Built a content-addressable dataset catalog with automated quality checks and a small **Python SDK**, reducing repeat dataset-prep work from several hours to under 30 minutes for common research workflows.
- Helped onboard 50+ curated datasets in three months by tightening metadata requirements, adding validation checks, and writing repeatable loading steps for research users.
- Added validation for missing fields, malformed records, inconsistent file formats, and incomplete metadata before datasets moved into downstream evaluation workflows.
- Mentored two junior engineers through code reviews, pair debugging, API-design discussions, and production support for metadata and platform services.

Kaseya

Backend Engineer Miami, FL | 10/2014 - 03/2018

- Co-designed a three-stage **Python** and **Node.js** event pipeline that used **Redis** deduplication and **PostgreSQL JSONB** storage to support MSP dashboard reporting across high-volume operational event streams.
- Implemented **OAuth 2.0** gateway authentication and transactional-outbox webhook delivery with **Celery** workers and idempotency keys for event notifications that needed reliable retry behavior.
- Migrated a monolithic billing procedure into **Python** services with parallel reconciliation, tenant-level isolation, and dead-letter handling for failed invoice workflows.
- Built **REST APIs** and an anti-corruption layer that kept ConnectWise, Autotask, and QuickBooks integrations working while internal legacy services were refactored.
- Improved backend reporting performance by moving repeated dashboard calculations into indexed data models and reusable pipeline components instead of recalculating them inside request paths.
- Worked with support and operations teams to investigate duplicate events, missing webhook deliveries, and slow dashboard queries that affected MSP reporting.

FIS

Software Engineer Jacksonville, FL | 07/2010 - 09/2014

- Built **JavaScript** dashboard widgets for a commercial banking portal using **SQL Server** stored procedures, indexed queries, and IE8-safe progressive enhancement.
- Delivered a full-stack dispute-resolution tool with server-enforced workflow states, nightly batch extracts, and database-level validation across three legacy systems.
- Improved dashboard response times by adding balance pre-aggregation, targeted indexing, and lighter frontend rendering for high-traffic banking workflows.
- Created a reusable widget library used by the frontend team during two-week prototype-and-demo cycles with product owners and business stakeholders.
- Worked with analysts, QA teams, and product owners to turn banking workflow requirements into maintainable web features and database-backed tools.

ADDITIONAL EXPERIENCE

Mathematics Tutor / Academic Support Assistant

Institute of Technology of Sonra Sonora, Mexico 08/2009 - 03/2010

hallucination risk, and instruction following.
- Added scoring helpers, edge-case flags, JSON-based test cases, and simple ranking views so reviewers could compare related model outputs more consistently.
- Used the toolkit to support technical QA workflows where model responses needed evidence-based review instead of surface-level scoring.

Skills: Python, LLM evaluation, rubric scoring, JSON, hallucination detection, instruction following, technical QA, model-output comparison

Backend Data Validation Pipeline

06/2024 - 12/2024

- Designed a lightweight **Python** and **SQL** pipeline to validate structured records before they moved into AI training or evaluation workflows.
- Added logging, retry handling, format checks, and alerting so inconsistent records could be caught earlier in the data-quality process.
- Supported internal quality checks for datasets used in reviewer workflows and downstream model-evaluation tasks.

Skills: Python, SQL, data validation, ETL pipelines, logging, retry handling, alerting, data quality

Rubric-Based Prompt Review Framework

03/2023 - 08/2023

- Created a standardized review rubric for AI-generated code and technical explanations across correctness, completeness, safety, and clarity.
- Trained three newer reviewers on evidence-based scoring, consistent feedback writing, and how to handle borderline cases without overcorrecting the model.

Skills: Rubric design, prompt review, coding-task evaluation, evidence-based scoring, reviewer training, reviewer calibration, technical QA
